

Nearly €5M in device deployment across Europe with zero-touch provisioning, security enforced from day one

The Outcome

A leading global mobility and delivery platform expanding across multiple European markets needed a secure, scalable way to deploy and manage thousands of mobile devices. Presidio designed and implemented an Apple-based deployment and lifecycle management program with zero-touch provisioning, centralized MDM integration, and a repeatable framework that scaled across countries without adding operational complexity.

How They Got There

Presidio recommended a standardized Apple deployment model supported by automated enrollment and centralized device management. Devices were procured centrally, configured automatically, enrolled securely, and delivered directly to end users - fully ready and compliant from day one. Asset tagging, inventory tracking, lifecycle management, and refresh programs completed the program.

Why It Worked

The organization was expanding fast across multiple countries, and a manual, market-by-market deployment approach couldn't keep pace without growing the operational team proportionally. By standardizing on Apple and automating provisioning, Presidio created a deployment model that scaled horizontally - adding new markets without adding complexity.

The Situation

A leading global mobility and delivery platform was rolling out a rapidly expanding digital service across multiple European markets and needed a reliable way to deploy and manage mobile devices at scale. The business required a solution capable of rapidly provisioning devices across multiple countries, maintaining security and compliance standards, and scaling alongside business growth.

The Approach

Presidio designed a standardized Apple-based deployment model built around zero-touch provisioning and centralized MDM integration. Devices were procured centrally, automatically enrolled and configured to the organization's security standards, and delivered directly to end users across Europe - arriving ready to use with all required policies enforced from day one. A repeatable deployment framework governed the process across every country.

The Result

The organization deployed nearly €5 million in Apple devices across multiple European markets over a two-year period, with zero-touch provisioning eliminating on-site configuration overhead. The repeatable deployment framework scaled across new markets without increasing operational complexity. Centralized MDM integration gave the technology team full visibility into device inventory, compliance status, and lifecycle requirements across all regions.

"Presidio helped us establish a scalable and secure deployment framework that allowed our organization to expand rapidly while maintaining operational consistency." — Senior Technology Operations Executive

~€5M

In Apple device procurement and deployment over two years

Zero-touch

Provisioning - devices delivered to end users, fully configured and enrolled

Multi-country

Deployment across European markets from a single repeatable framework
